Editor: Craig Boutilier

There is an error in the description of the Dor and Tarsi (1992) algorithm, which is given as follows on Page 454:

> We then repeat the following procedure: First, select a node x in $\mathcal{P}$ such that (1) x has no outgoing edges and (2) if N_x is non-empty, then $N_x \cup \Pi_x$ is a clique.

The second condition above should instead be

> (2) if N_x is non-empty, then N_x is a clique and every node in N_x is adjacent to every node in Π_x.

Acknowledgments

I would like to thank Carlos Cotta for identifying this error.
